/note="Vector: palescript SK(+) vector DNA, phagemid excised from lambda ZAP; Site_1: EcoRV; Site_2: EcoRV; Genomic DNA was prepared from asynchronous blood stage forms of the cloned ANKA isolate of P. berghei grown in laboratory Swiss white mice. The DNA was purified from contaminating host DNA by Hoechst Dye 33258-CSC1 ultracentrifugation and precipitated. Purified DNA was digested with mung bean nuclease in the presence of 36-38% formamide at 50 C, as described (Vernick, K.D., Imberski, R.B., and McCutchan, T.F. 1988. Nucleic Acids Research 16:6883-6896). The ends of the digestion fragments were polished using T4 DNA polymerase, and the fragments size selected in the range 500-2000 bp. These were ligated into the EcoRV-cleaved and dephosphorylated pBluescript SK(+) vector. Recombinant plasmids were used to transform E. coli XL10-Gold host cells. 1 others

primer and reverse transcriptase in the presence of 5-methyl dCTP. After second strand synthesis, uneven termini were treated with Pfu DNA Polymerase and EcoRI adaptors ligated to the blunt ends. The sample was cleaved with XhoI and separated on a Sephacryl S-500 column. Size-fractionated cDNA was precipitated and ligated to HybrizAP arms directionally using EcoRI-XhoI cleaved arms. After packaging, the phagemid vector (PAD-GAL4) was excised from the HybrizAP vector and plasmid DNA

/note="Vector: pAD-GAL4; At 20-25% parasitemia, blood was collected from BALB/CByJ mice infected with Py17XL parasites, and leukocytes removed by passage over microcrystalline cellulose collumns. Total RNA was isolated using the guanidinium isothiocyanate method, and mRNA isolated using oligo(dT)-cellulose chromatography. First strand cDNA synthesis was completed using a 50-base
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ysileSerileArgGlyAsnArgileIleTrpThrLeuileAspileAsn 128

using a method described by Clark and Diamond (Clark, C.G., and Diamond, L.S. (1993) Entamoeba histolytica: a method for isolate identification. Exp. Parasitol. 77:450.). The DNA was mechanically sheared to give a tight size distribution (-2 kb). The v + i method used for the library construction is described in detail in Smith, H.O. and Venter, J.C. (Making small insert libraries for whole genome shotgun sequencing projects. In Genome Sequencing: A Practical Approach, eds. M. Vaudin and B. Barelli, Oxford University Press, 1999)."

Genomic DNA isolated from broth cultures of E. histolytica using a method described by Clark and Diamond, L.S. (1993) Entamoba histolytica: a method for isolate identification. Exp. Parasitol. 77:450.). The DNA was mechanically sheared to give a tight size distribution (-2 kb). The v + 1 method used for the library construction is described in detail in Smith, H.O. and Venter, J.C. (Making small insert libraries for whole genome shotgun sequencing projects. In Genome Sequencing: A Practical Approach, eds. M. Vaudin and B. Barell, Oxford University Press, 1999)."

//note="Vector: pBlueScript II (SK-); Site_l: EcoRV; C.
parvum (IOWA isolate) genomic DNA was hydrodynamically
sheared to produce fragments having a tight size
distribution between 2-4 kb by Dr. Yvonne Thorstenson of
the Stanford DNA Sequencing and Technology Center
(http://sequence-www.stanford.edu/group/techdev/shear.htm
). The randomly sheared gDNA was chromatographed on
Sephacryl S-400 to remove any small fragments and DNA
eluting in the void volume was subcloned into an EcoR
V-digested, alkaline phosphatase-treated pBlueScript II
(SK-) vector and transformed into E. coli strain XL2 Blue
MRF'. Recombinant clones from the first plating of the
library were selected for sequence analysis using T3 and
T7 primers."

The library was prepared by Michelle Lizotte-Waniewski for Alan
Scott, Johns Hopkins University Medical School, Baltimore.
Sequencing was performed by the Pathogen Sequencing Unit, Sanger
Centre, Cambridge, UK (Neil Hall, Mike Quail & Bart Barrell). The
Sequence contained a PolyA tail (trimmed)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1. 546

The linary was prepared by Michelle Lizotte-Waniewski for Alan
Scott, Johns Hopkins University Medical School, Baltimore.
Sequencing was performed by the Pathogen Sequencing Unit, Sanger
Centre, Cambridge, UK (Neil Hall, Mike Quall & Bart Barrell). The
sequence contained a PolyA tail (trimmed)
PCR PRIMERS

botulinum toxin serotypes A-G, is used for inducing an immune response against Novel Botulinum neurotoxin vaccine comprising a fragment from botulinum

Disclosure; Page 39-40; 54pp; English.

The invention relates to novel vaccines that induce a protective immune response against botulinum neurotoxin (BoWT) serctypes A. B. C. D. E. F. and G (BoNTA-BONTG). The vaccine of the invention is novel recombinant DNA construct comprising a vector, and at least one nucleic acid fragment comprising a Vector, and at least one nucleic acid fragment comprising a C-terminal heavy chain fragment (Hc) from BoNT serotypes A-G. In preferred embodiments of the invention. The vector is a venezuelan equine encephalitis virus (VEE) replicon vector. Use of this vector results in the production of large amounts of a protein encophalitis in the production of large amounts of a protein conded by a sequence cloned into the replicon. The constructs are used to produce vaccines against botulism. The proteins can also be used as diagnostic tools for the diagnosis of botulism. The transformed host cells can be used to analyse the effectiveness of drays and agents which inhibit tool and expensive to produce, and contains formalin, which is very painful for the recipient. Also, the vaccine is incomplete, in that only 5 of the 7 serotypes are represented in the formulation. The novel vaccine of overcomes these problems, as it is easily purified, and available in large quantities. It is also expressed in the lymph nodes for a better immune response. Sequences AZSR712-Z87217 represent synthetic DNA sequences encoding BONT Hc fragments used in the present invention. These were optimised for codon usage for expression in yeast.

```

Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain which consisting of a 100 kDa heavy chain and a 50 kDa light chain which remain linked by a disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy calin neurotoxin (BONT) can be used in recombinant expression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant organisms such as Escherichia coll or Pichla pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin-producing bacterium. Production yield from the genetically engineered product is also high and cost of production is lower. The nucleic acids can Clostridium botulinum serotypes A-G.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ŏ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain which consisting of a 100 kDa heavy chain and a 50 kDa light chain which remain linked by a disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT) can be used in recombinant expression vectors and expressed in transformed cells to produce to peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant cognition as Escherichia coli or Pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin-producing the neighbor the production production and the generically engineered product the new to the product the generically engineered product the production and the generically engineered product the product the product the product the generically engineered product

The encoded fragment C polypeptide (see AAM68394) has a His-tagged N-terminal extension. The vector was used to express native (i.e. non-fusion) soluble C fragment in Escherichia coli host cells. The invention relates to recombinant proteins derived from C. botulinum toxins. Methods are provided which allow for the isolation of soluble recombinant proteins free of significant endotoxin contamination. Preferred hosts for production of

                                                                                                                                                                                                                                  This is the coding region of the Clostridium botulinum serotype B (Danish strain) toxin gene that codes for a 1291-amino acid polypeptide (see AAW68392). The C fragment (see AAW68394) of the B toxin has been expressed as histidine-tagged protein in Escherichia coli host cells. The invention relates to C. botulinum recombinant

toxin polypeptides. Methods are provided which allow for the isolation of soluble recombinant proteins free of significant endotoxin contamination. Preferred hosts for production of the recombinant proteins are E. coli, insect cells and yeast cells. The recombinant proteins are used as immunogens for the production of vaccines and antitoxins that are useful in the treatment of humans and animals at risk of intoxication with clostridial toxin.

This is the DNA sequence of the Clostridium botulinum serotype B toxin fragment C gene contained in plasmid phisbotb. The encoded fragment C polypeptide (see AAW66393) has a histidine-tagged ragment c polypeptide (see AAW66393) has a histidine-tagged N-terminal extension. The vector was used to express native (i.e. non-fusion) soluble C fragment in Escherichia coli host cells. The invention relates to recombinant proteins derived from C. botulinum toxins. Methods are provided which allow for the isolation of soluble recombinant proteins free of significant endotoxin contamination. Preferred hosts for production of recombinant toxins are E. coli, insect cells and yeast cells. The recombinant toxins are used as immunogens for the production of vaccines and antitoxins that are useful in the treatment of humans and animals at risk of intoxication with clostridial toxin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              gacaacaatctgatcgatctgtctggttacggtgctaaagttgaagtatacgacggtgtt 129

plasma membrane associated proteins essential to exocytosis, and where plasma membrane associated proteins essential to exocytosis, and where the second domain is adapted: (a) to translocate the protein into a cell; (b) to increase the solubility of the protein compared to the solubility of the first domain on its own, or (c) both to translocate the protein into a cell and to increase the solubility of the protein compared to the solubility of the first domain on its own, the protein being free of clostridial neurotoxin (CN) and free of CN precursor that proteins can be used as therapeutic agents for targeting cells expressing a relevant substrate. The products can also be used as immunogens and as non-toxic standards for the assessment and development of in vitro assays for the detection of functional botulinum or tetanus neurotoxins either in foodstuffs or in environmental samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2733
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             2913

Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain consisting of a 100 kDa heavy chain and a 50 kDa light chain which remain linked by a disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy chain of botulinum neurotoxin (BONT) can be used in recombinant expression vectors and expressed in transformed cells to produce the peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant corganisms such as Escherichia coli or Pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin-producing the need to culture large quantities of hazardous toxin-producing the acterium. Production yelloff from the genetically engineered product.

```
The invention relates to novel vaccines that induce a protective immune response against botulinum neurotoxin (BoNT) serotypes A, B, C, D, F, F and G (BoNTA-BoNTG). The vaccine of the invention is novel recombinant DNA construct comprising a vector, and at least one nucleic acid fragment comprising a vector, and at least one nucleic acid fragment comprising a vector, and at least one nucleic acid fragment comprising a vector, and at least one nucleic acid fragment comprising a vector, and at least one vector is serotypes A-G. In preferred embodiments of the invention, the vector is a venezuelan encephalitis virus (VEE) replicon vector. Use of this vector results in the production of large amounts of a protein encoded by a sequence cloned into the replicon. The constructs are used to produce vaccines against botulism. The proteins can also be used as diagnostic tools for the diagnosis of botulism. The transformed host cells can be used to analyse the effectiveness of drugs and agents which inhibit toxin effects. The vaccine currently used against botulism is canned expensive to produce, and contains formalin, which is very painful for the recipient. Also, the vaccine is incomplete, in that only 5 of the 7 serotypes are repersented in the formulation. The novel contains formulation in large quantities. It is also expressed in the lymph nodes contains better immune response. Sequences AARSTAI represent

Botulism neurotoxins are translated as a single 150 kDa polypeptide chain and then posttranslationally nicked, forming a dichain consisting of a 100 kDa heavy chain and a 50 kDa light chain which remain linked by a disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoVT) can be used in recombinant expression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant organisms such as Escherichia coli or pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         the need to culture large quantities of hazardous toxin-producing bacterium. Production yield from the genetically engineered product is also high and cost of production is lower. The nucleic acids can be derived from clostridium botulinum serotypes A-G.

Botulism neurotoxins are translated as a single 150 kba polypeptide chain and then posttranslationally nicked, forming a dichain consisting of a 100 kba heavy chain and a 50 kba light chain which remain linked by a disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT) can be used in recombinant expression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulinum neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant corganisms such as Escherichia coli or Pichia pastoris. The use of recombinant nucleic acids are advantageous since it eliminates the need to culture large quantities of hazardous toxin-producing bacterium. Production yield from the genetically engineered product

```
A synthetic gene (AAT29245) codes for the heavy chain C fragment (AAR89508) of Clostridium botulinum type A neurotoxin (see also AAR95010). Codon usage allowing efficient gene expression in Escherichia coli was utilised. The gene in vector palterBot was used to make expression constructs in which fragments of C difficile toxin A repeat domains were expressed as genetic fusions with the C. botulin C fragment and expressed in E. coli.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This is the DNA sequence of the Clostridium botulinum serctype A toxin C-fragment gene contained in plasmid palterBot. Recombinant C-fragment proteins have been produced in Escherichia coli as fusion proteins with either maltose binding protein or clostridium difficile type A toxin (see AAW68387). The invention relates to recombinant proteins derived from C. botulinum toxins. Methods are provided which allow for the isolation of soluble recombinant proteins free of significant endotoxin contamination. Preferred hosts for production of recombinant proteins are E. colininsect cells and yeast cells. The recombinant toxin proteins are insect ells and yeast cells. The recombinant toxin proteins are used as immunogens for the production of vaccines and antitoxins that are useful in the treatment of humans and animals at risk of

Nucleic acids encoding the carboxy-terminal (HC) or amino-terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT) can be used in recombinant expression vectors and expressed in transformed cells to produce peptide antigens useful for eliciting an immune response to give protective immunity against botulium neurotoxin, which causes botulism. The nucleic acids are expressible in a recombinant organisms such as Escherichia coli or Pichia pastoris. The use
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             portions useful as

recombinant nucleic acids are advantageous since it eliminates e need to culture large quantities of hazardous toxin-producing cterium. Production yield from the genetically engineered productalso high and cost of production is lower. The nucleic acids ca derived from Clostridium botulinum serotypes A-G.

"Synthetic botulinum neurotoxin serotype A (BoNTA) heavy chain C-terminal fragment (HC)"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel Botulinum neurotoxin vaccine comprising a fragment from botulinum toxin serotypes A \cdot G, is used for inducing an immune response against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to novel vaccines that induce a protective immune response against botulinum neurotoxin (BONT) serotypes A, B, C, D, E, F and G (BONTA-BONTG). The vaccine of the invention is novel recombinant DNA construct comprising a vector, and at least one nucleic acid fragment comprising a C-terminal heavy chain fragment (Hc) from BONT serotypes A-G. In preferred embodiments of the invention, the vector is a Venezuelan equine encephalitis virus (VEE) replicon vector. Use of

this vector results in the production of large amounts of a protein encoded by a sequence cloned into the replicon. The constructs are used to produce vaccines against botulism. The proteins can also be used as diagnostic tools for the diagnosts of botulism. The transformed host calls can be used to analyse the effectiveness of drugs and agents which inhibit toxin effects. The vaccine currently used against botulism is dangerous and expensive to produce, and contains formallin, which is very painful for the recipient. Also, the vaccine is incomplete, in that only so of the 7 serotypes are represented in the formulation. The novel vaccine of overcomes these problems, as it is easily purified, and available in large quantities. It is also expressed in the lymph nodes for or a better immune response. Sequences AA28712.7287217 represent synthetic DNA sequences encoding BONT He fragments used in the present invention. These were optimised for codon usage for expression in yeast.
